

Recap

- **Git vs Github**
- **GHE**
- **Data types**
- **Python iterations: for loops and while loops**
- **If, if..else, if..elif..else**
- **try/except**
- **Python functions**

Classes

- **Object-oriented programming paradigm (OOP)**
 - **Building reusable blocks of code (object)**
- **Block of code that combines information and behaviour that can be performed on data to solve a problem**

Terminology

- **Behaviour:** actions that are defined within a class. They are made up of methods
- **Methods:** functions defined within a class
- **Information (Attributes):** variables that are part of the class
- **Object:** an instance of a class. You can have as many objects as you want for one class.

Class Structure

```
import numpy as np
```

```
class Robot:
```

```
    def __init__(self):
```

```
        self.x = 0
```

```
        self.y = 0
```

Attributes

```
    def move_up(self, increase):  
        self.y = self.y + increase
```

```
    def move_down(self, decrease):  
        self.y = self.y - decrease
```

```
    def move_right(self, increase):  
        self.x = self.x + increase
```

```
    def move_left(self, decrease):  
        self.x = self.x - decrease
```

Methods

```
    def calc_distance(self):  
        # From Pythagora's Theorem  
        distance = ( np.abs(self.x)**2 + np.abs(self.y)**2 )**0.5  
        return distance
```

Methods

```
myRobot = Robot()
```

```
myRobot
```

```
<__main__.Robot at 0x11131c080>
```

```
myRobot.move_up(2)  
myRobot.move_right(3)  
myRobot.move_left(2)  
myRobot.move_down(6)  
myRobot.calc_distance()
```

```
4.123105625617661
```

Making multiple objects from one class

```
myRobots = []  
  
for i in range(0,4):  
    myrobot = Robot()  
    myRobots.append(myRobot)
```

```
myRobots
```

```
[<__main__.Robot at 0x11131c080>,  
 <__main__.Robot at 0x11131c080>,  
 <__main__.Robot at 0x11131c080>,  
 <__main__.Robot at 0x11131c080>]
```
